Lower Mare aux Vacoas, Mauritius

Beau Bassin-Rose Hill, Quatre Bornes, Ebène, and the Black River coast: the same rationed reservoir as the plateau, but hotter and at the centre of this year's chikungunya outbreak. The first job is to clear the breeding sites in the outbreak streets.

IMPACT REGION	EXCESS HEAT DEATHS	WINDOW	DOMINANT HAZARD
Straddles two: MUS.Rb4955ae83ec (label unconfirmed) and MUS.R8e39d7d595c (label unconfirmed)	None published for Mauritius	Study: Jun 2026 – Feb 2027	Mosquito-borne disease, water rationing, heat, flash floods

14/14 recommendations verified. 8 corrected, 0 unverified, 6 contraindicated. 1 funding placement unverified (the Rs 2.5M Victoria Hospital dialysis contingency). Exposure figure: Climate Impact Lab, *451,000 at Risk* (Sep 2026, pre-peer-review) publishes no figure for Mauritius, and none has been scaled here. **The funding target fell by more than three-quarters in verification**, from Rs 9.4M to Rs 2.1M. No local recipient has a record at the proposed scale, and a cash placement was contraindicated as a duplicate of an existing allowance.

EXECUTIVE SUMMARY — AT A GLANCE

20.28°S 57.43°E, Mauritius · Natural Earth

- **The risk.** Quatre Bornes and Rose Hill led a chikungunya outbreak of 6,891 confirmed cases by 28 August. Rationing now fills their homes with stored water just as the mosquito season starts.
- **First action.** Health ministry vector teams and the councils clear and cover breeding sites in the outbreak streets, house to house, by 30 November.
- **The money.** Floor Rs 1.2M, target Rs 2.1M, ceiling Rs 5.8M ($25k / $44k / $121k). The covers pilot buys the most.
- **Do not.** Tell older people to avoid fans or take cool showers. Fans are safe at these temperatures, and showers fail when the taps are off.*

THE PREMISE

READ FIRST

This is not an "El Niño drought". El Niño has almost no measurable effect on Mauritius rainfall. Across 20 stations from 1960 to 2011, ocean indices explained an average adjusted R^2 of 0.036 of monthly rain (conference slides, not peer-reviewed). The worst recent droughts, 1998–99 and 2011–12, fell in La Niña years. The last El Niño summer, 2023–24, brought 140% of normal rain and the largest dengue outbreak on record. The Mauritius Meteorological Services (MMS) bulletin of 10 August 2026 puts October–December rain at about 92% of normal (near-normal to slightly dry), warmer than normal. The regional SWIOCOF outlook puts the chance of record temperatures at more than five times normal.

This zone shares Mare aux Vacoas (MAV) with the plateau, so it shares the **water deficit carried over** from a 2025–26 summer with 66% of normal rain. On 9 October MAV held 35.5%, with about 20% projected by the end of November. Quatre Bornes, Beau Bassin, Rose Hill, and part of Black River have been on **6 hours of supply a day** under the CWA communiqué of 15 June, effective 17 June. The plateau's every-other-day, 3–8 a.m. regime from 10–11 October (press notice of 9 October) does not, on the published notices, apply here, and no newer schedule for this zone was found. The west also leans on La Ferme reservoir (42.5% on 29 September 2026) and on 70 boreholes, the most of any CWA zone. Unlike the plateau, this zone is **lowland and hot**, and it was the **centre of the 2026 chikungunya outbreak**. Flash floods and cyclones from December to April complete the picture.

Scope: the Central Water Authority (CWA) MAV Lower supply zone, about 260,000 people (WorldPop 2020 estimate; the census does not publish supply-zone totals). Beau Bassin-Rose Hill has 92,149 people and Quatre Bornes 71,076; Black River district has 87,701 (Census 2022, Statistics Mauritius), but only part of it is fed from MAV. Ebène, the office district between Rose Hill and Quatre Bornes, is in Plaines Wilhems and inside the zone; it is mostly offices, so no action here is specific to it, but its workers count in the heat and flood actions. Le Morne appears to be supplied from Baie-du-Cap and is probably outside the zone. Victoria Hospital (Candos), the regional hospital and dialysis unit for both MAV zones, sits here.

WHAT THIS PLACE SHOULD DO

RANKED

Ranked by expected lives saved per unit of effort before the peak. Backing lenses are shown per action; an action several lenses reached

* Suggested formulation: check with a health worker before sharing.

independently is the stronger bet.

1. Clear and cover breeding sites in the 2026 outbreak streets, house to house, by 30 November

PARTIALLY CONFIRMED · PUBLIC HEALTH · FRONTLINE · SKEPTIC · EMERGENCY MANAGER · PHILANTHROPIST · HISTORIAN · ADAPTATION INVENTORY: NO ENTRY

OWNER	BY WHEN	COST	PREVENTS
Ministry of Health, Vector Biology and Control Division, with the two municipal councils	Start now; first round by 30 Nov	Rs 0.6M pilot, 1,000 households at Rs 600 (assumed unit cost)	Chikungunya and dengue bred in rationing water

On 4 May 2026 the outbreak's hotspots were in this zone: rues Berthaud, Palma, and Boundary in Quatre Bornes, then Rose Hill, Stanley, Trèfles, Camp-Levieux, and Bambous. Six hours of supply a day means every home stores water. Teams start in those streets: check each yard, fit lids or tied cloth or mesh, put larvicide in drums that cannot be sealed, clear the vacant lots and blocked drains residents of Roches-Brunes and Stanley have complained about, and teach "refill day is scrub day". Because *Aedes albopictus* breeds outdoors as well as in stored water, every visit includes the yard. Evidence: in the Camino Verde cluster randomised trial, community container management cut recent dengue infection in children by 29.5% (95% CI 3.8–55.3). The review evidence for container covers is "very weak" (a single Cuban study, odds ratio 0.22).*

Transferability: the trials targeted *Ae. aegypti* in Latin America. The hotspot list is five months old (cases at 4 May), so the vector division should re-target from current case data. Caritas Île Maurice (47 parishes, 1,147 volunteers, an emergency-relief unit) can supply people. Kolektif Rivier Nwar in Rivière Noire can mobilise its community, but has no health work and an operating budget of about Rs 1.3M.

2. Keep dialysis running at Victoria Hospital: a fixed daily tanker slot, 48–72 hours of feed water, and early sessions before any cyclone

PARTIALLY CONFIRMED · PUBLIC HEALTH · EMERGENCY MANAGER · PHILANTHROPIST · ADAPTATION INVENTORY: NO ENTRY

OWNER	BY WHEN	COST	PREVENTS
Ministry of Health and Wellness, with CWA	Storage audit by 15 Nov	Rs 2.5M contingency, released only on a confirmed gap	Missed sessions, which raise the risk of death

* Suggested formulation: check with a health worker before sharing.

Victoria Hospital in Candos opened Mauritius's first public haemodialysis unit in 1995 and is one of five regional hubs; it serves patients from both MAV zones. About 1,600 people depend on dialysis nationally. Three steps: confirm 48–72 hours of raw feed-water storage upstream of the reverse-osmosis plant; give the hospital a fixed daily tanker slot (the CWA communiqué of 15 June, effective 17 June, already gives hospitals tanker priority); and plan to bring sessions forward when a cyclone warning is issued. After Hurricane Sandy, early dialysis was associated with lower odds of death within 30 days (adjusted odds ratio 0.72, 95% CI 0.52–0.997; Lurie et al., *AJKD* 2015). After Katrina, missing three or more sessions roughly doubled the odds of hospital admission (OR 2.16; Anderson et al., *Kidney International* 2009). In DOPPS, skipping sessions went with 30% higher mortality.

All three studies are observational, from the United States and elsewhere. No 2026 report of a water problem at Victoria Hospital was found, and national dialysis water quality is described as rarely an issue. The money is therefore a contingency. The hospital's one documented fault is operating-theatre air-conditioning broken since February 2024, which matters for heat.

3. Check on older people living alone in the heat, Black River first, and start counting deaths by district now

PARTIALLY CONFIRMED | PUBLIC HEALTH · EMERGENCY MANAGER · SKEPTIC · PHILANTHROPIST · FRONTLINE

ADAPTATION INVENTORY: HEAT WARNING PRECEDENTS (ITALY, CANADA, US)

OWNER	BY WHEN	COST	PREVENTS
Ministry of Health, with the Senior Citizens Council and MMS	**Threshold and roster by 30 Nov**	**Rs 0.6M Black River pilot; Rs 1.5M full**	**Heat deaths among isolated, diabetic, and older people**

The west coast and lowland towns are hot, and record temperatures are more likely than usual this summer. Ministry doctors already visit 29,581 people a month at home, including everyone aged 90 and over and bedridden people on carer's allowance. Use that roster: on days above a threshold agreed with MMS, Senior Citizens Council associations and Red Cross volunteers phone or visit those who live alone. Their advice is fans plus skin-wetting with a damp cloth, drinking water, and a medication check. Open cool, water-supplied rooms in town halls and community centres in Rose Hill, Quatre Bornes, and Bambous. And ask the Civil Status Division for a daily feed of registered deaths by district, against a 2019–2025 baseline, so excess deaths from December to February are seen rather than guessed at. Deaths must be registered within 24 hours, so the data exists.*

Evidence is extrapolated: Ahmedabad's heat action plan was followed by about 1,190 fewer deaths a year (pre/post, no control; Hess et al. 2018). A meta-analysis of six case-control studies found visiting cool places cut the odds of heat death (OR 0.34) and social contact helped (OR 0.40); fans and showers were not significant (Bouchama et al. 2007). No Mauritian heat-mortality study and no MMS heat-

* Suggested formulation: check with a health worker before sharing.

warning criteria were found, so the threshold must be set locally.

4. Take water to the door for people who cannot collect it, and site the new community tanks at the end of the network and at Carré-d'As

PARTIALLY CONFIRMED | FRONTLINE · EMERGENCY MANAGER · SKEPTIC | ADAPTATION INVENTORY: NO ENTRY

OWNER	BY WHEN	COST	PREVENTS
CWA, with the councils, Caritas, and volunteers	Register and tank sites by 15 Nov	Within Cabinet's 9 Oct package; no new quote	Dehydration and unrest where supply fails first

Cabinet has funded 30,000-litre tanks for "different sub-localities", with no siting criteria published, and 10 tanker liaison officers. Ask that the first go where supply fails first. In Camp-Levieux, protests over water on 8 October ended in three arrests. At Carré-d'As, Rivière Noire, 56 squatter families with more than 60 children live about 50 m from the Royal Road, with two reservoirs "often empty" and their connection cut; they wash dishes in the sea. Volunteers build a buddy list of people living alone, bedbound, or without a tank, and a neighbour fills their containers when supply comes. They log empty days at informal sites on WhatsApp and send it weekly to the liaison officers.

Evidence: UK utilities must deliver to registered vulnerable customers during supply cuts; no trial measures mortality. An earlier report of 17 families without water near Bambous is out of date: they were connected in September 2025.

5. Run tank-grant filing clinics, and ask DBM two questions: will every tank have a sealed lid, and can squatters apply?

PARTIALLY CONFIRMED | FRONTLINE · EMERGENCY MANAGER · HISTORIAN · PHILANTHROPIST | ADAPTATION INVENTORY: NO ENTRY

OWNER	BY WHEN	COST	PREVENTS
Ministry of Energy and Public Utilities; DBM pays, CWA inspects	Saturdays to 30 Nov	No new money: Rs 15,000 voucher funded by Cabinet	Exclusion of the households least able to store water

* Suggested formulation: check with a health worker before sharing.

On 9 October Cabinet opened the Water Tank and Pump Grant to every household without a tank, tenants included, with no income test: a Rs 15,000 voucher from the Development Bank of Mauritius (DBM), run by the CWA and DBM, reportedly Rs 10,000 for tanks, Rs 4,000 for a pump, and Rs 1,000 for fittings. Volunteers help elderly and Kreol-only households file, at parish halls and at Caritas's Centre of Learning in Barkly (to be confirmed by phone before use). Two questions need answers from DBM. The last published document list (2022) required a CWA bill, which squatters without a connection cannot produce. And no lid or screened-vent rule has been published.

The grant adds storage, which people need to catch a 6-hour supply. Without lids it also adds breeding sites in the outbreak streets; see "Do not do this".

6. Agree before December which underpasses, underground car parks, and fords close automatically on a heavy-rain warning

PARTIALLY CONFIRMED | EMERGENCY MANAGER · SKEPTIC | ADAPTATION INVENTORY: NO ENTRY

OWNER	BY WHEN	COST	PREVENTS
NDRRMC, with the Local Emergency Operations Commands and police	1 Dec	About Rs 0.5M for barriers and signs (estimate)	Drownings below ground and on flooded roads

On 30 March 2013, 152 mm of rain in under 90 minutes killed 11 people in Port Louis, most of them in a pedestrian underpass and an underground car park; the response plan had assumed people were safe below ground. Cyclone Belal in January 2024 killed a motorcyclist on a flooded road. The Local Emergency Operations Commands of Beau Bassin-Rose Hill, Quatre Bornes, and Black River list the equivalents in their areas and agree with police that they close as soon as MMS issues a heavy-rain warning. They also write down how CWA tanker crews switch from water rounds to flood duty.

* Suggested formulation: check with a health worker before sharing.

Local evidence is thin: no flood deaths were found in Beau Bassin-Rose Hill, Quatre Bornes, or on the Black River coast, and the Land Drainage Master Plan's 16 high-risk zones have not been named publicly. The action rests on the national record.

7. Put the big private water users on the table: publish their abstraction, take over surplus boreholes, and watch coastal salinity

PARTIALLY CONFIRMED | ECONOMIST · HISTORIAN · SKEPTIC | ADAPTATION INVENTORY: NO ENTRY

OWNER	BY WHEN	COST	PREVENTS
Ministry of Energy and Public Utilities, with the Water Resources Unit and CWA	Register by 30 Nov; take-overs as agreed	Net saving against tanker and desalination costs (unquoted)	Households rationed while private boreholes run surplus

There is a working precedent. In November 2016 the CWA took over ENL's Telfair borehole (1,800–2,000 m³ a day) and sent about 1,000 m³ a day to the Rose Hill reservoir. Hotels, golf courses, and Smart City and property-scheme estates on the west coast draw their own water; in July 2026 Cabinet raised their non-domestic tariffs by about 75% and raw-water royalties by about 65%, which implies abstraction is metered. Publish who draws what during rationing, negotiate surplus into the network, and publish monthly conductivity readings for coastal boreholes with a cut-off for each well.

Corrections: the 30% fall in tanker requests often quoted with the 2016 take-over came from a separate injection in Grand Baie. The Rs 100/m³ figure is a former CWA engineer's estimate of desalination cost, not a hotel cost. That hotels draw water while households are rationed is plausible but undocumented for this zone, and no public abstraction register was found.

8. Register the west coast's card-less fishers for the Bad Weather Allowance before the cyclone season

PARTIALLY CONFIRMED | ECONOMIST · FOOD SUPPLY CHAIN | ADAPTATION INVENTORY: NO ENTRY

OWNER	BY WHEN	COST	PREVENTS
Ministry of Blue Economy and Fisheries	Registration drive by 30 Nov	Rs 800 per bad-weather day per added fisher (existing line)	Fisher households going without food or cash in cyclone weeks

* Suggested formulation: check with a health worker before sharing.

The Bad Weather Allowance is already a working parametric scheme: Rs 800 for each bad-weather day declared from the meteorological station, paid to about 2,500 registered fishers (about Rs 40M a month), computerised since April 2026. Card-less fishers get nothing, and some have waited more than ten years for a card. Running a registration drive at the Rivière Noire, La Gaulette, and Tamarin landing stations before December closes the gap through a scheme that already pays on a trigger.

The food-supply lens also proposed paying the allowance on marine-heatwave days, using NOAA Coral Reef Watch's Mauritius virtual stations (heating of 8 degree-weeks or more). No such scheme exists anywhere; it is a novel idea for 2027, not a replication.

* Suggested formulation: check with a health worker before sharing.

WHO DOES WHAT

RACI CHART

R = Responsible (does the work) · **A** = Accountable (one per action; signs off and answers for it) · **C** = Consulted (asked before) · **I** = Informed (told after). Built from the owners named in the verified actions. No one here has been contacted or has agreed to a role; every row is a proposal.

Action	MoH	CWA	MEPU	DBM	Councils	NDRRMC	MMS	Blue Econ.	SCC	Caritas	Volunteers
1. Clear and cover breeding sites	**A/R**	**I**			**R**					**R**	**R**
2. Dialysis water at Victoria Hospital	**A/R**	**R**	**I**			**C**	**I**				
3. Heat checks and death counts	**A**				**R**		**C**		**R**		**R**
4. Doorstep water and community tanks	**C**	**A/R**	**I**		**R**					**R**	**R**
5. Tank-grant clinics	**C**	**R**	**A**	**R**	**I**					**R**	**R**
6. Underpass and ford closures		**C**			**R**	**A**	**C**				
7. Large private water users		**R**	**A**		**I**						
8. Fisher registration						**I**	**C**	**A/R**			**R**

What the chart shows: the Ministry of Health is accountable for the three rows that most directly save lives (1–3). The Ministry of Energy and Public Utilities (MEPU) holds the two rows that need a decision rather than money: the grant's terms and the large-user register. MMS appears only as consulted, but action 3 cannot start until it agrees a heat threshold.

WHERE MONEY DOES THE MOST

FUNDING

The Philanthropist lens, reconciled against the ranked actions and verified. Placements are ranked by marginal lives saved per dollar. The envelope is bounded by what this place can spend before the peak, not by what it needs.

FLOOR

Rs 1.2M ($24,945)

TARGET

Rs 2.1M ($43,654)

CEILING

Rs 5.8M ($120,567)

LARGEST UNCERTAINTY

Whether any local group can spend more than a pilot before December

Arithmetic at Rs 48.1061 per US dollar (MRA customs rate, week 41, 12 Oct 2026). Rs 600 a household for a covers kit (lid or cover, mesh, larvicide where safe) is an assumption used across the Mauritius set; there is no Mauritian quote, so covers money is released only against a written supplier quote. Floor = covers pilot 0.6M (1,000 households × Rs 600) + heat-check pilot in Black River 0.6M (3 coordinators × Rs 20,000 × 5 months + Rs 0.3M transport and water) = Rs 1.2M. Target = floor + 0.9M to take heat checks to the full Rs 1.5M if the pilot meets its milestones by month two = Rs 2.1M. Ceiling = target + dialysis contingency 2.5M + covers scale-up 1.2M (2,000 more households × Rs 600), each released only on its condition = Rs 5.8M. **The target fell from Rs 9.4M to Rs 2.1M in verification.** The covers placement was cut to the same pilot used in MAV Upper, and its 40 paid workers dropped as a duplicate of the ministry's teams. The dialysis reserve moved to the ceiling

* Suggested formulation: check with a health worker before sharing.

because no water gap has been reported. A Rs 5M cash transfer was contraindicated: Social Register households already receive a Rs 3,000 monthly income allowance, neither proposed recipient has paid cash before, and nothing shows cash reduces deaths from these hazards. Clinic readiness for this zone's clinicians is funded in the MAV Upper briefing and not counted again here. The national trigger-cash line (MU-F01: Rs 5,000 a household, Rs 2.8M cap per trigger, paid by the NEF and NSF on an MMS warning and shared by all six zones) sits outside this envelope; it is a separate, island-wide rule, not the zone cash placement dropped here.

RECIPIENT	USE	AMOUNT	MECHANISM	BASIS	VERDICT
Caritas Île Maurice parishes, targeted by the vector division	Action 1: covers, mesh, larvicide, and yard clean-up, 1,000-household pilot	Rs 0.6M ($12,472)	Direct grant	Community participation cost $3,953 per DALY in Colima, Mexico (2008 USD), though that package had no covers or larvicide; Camino Verde cost $29,618 per DALY in Guerrero. Unit cost Rs 600 a household is an assumption (no Mauritian quote); released only against a written supplier quote.	CORRECTED
Senior Citizens Council associations, Black River	Action 3: heat checks from the ministry's home-visit roster, pilot	Rs 0.6M ($12,472)	Direct grant	Philadelphia's heat warning system: about 117 lives for $210,000 over 1995–98 (Teisberg, Ebi et al.; p≈0.08). That costed a citywide system, so it is weak support for volunteer checks.	CORRECTED
Senior Citizens Council associations	Action 3: extend heat checks to Rose Hill and Quatre Bornes	Rs 0.9M ($18,709)	Direct grant, on milestones	Released if the pilot reaches its roster by month two	CORRECTED
Ministry of Health (Victoria Hospital)	Action 2: dialysis feed-water storage and tanker standby	Rs 2.5M ($51,968)	Pre-positioned, contingent	Released only on written confirmation of a gap when MAV falls below 20%; no Mauritian costing found	UNVERIFIED
Caritas Île Maurice parishes	Action 1: covers scale-up, 2,000 more households	Rs 1.2M ($24,945)	Direct grant, on pilot results	Same assumed Rs 600 unit cost as the pilot (2,000 × Rs 600); released only against a written supplier quote	CORRECTED

* Suggested formulation: check with a health worker before sharing.

The funder's one thing: the government's tank grant is adding thousands of new water containers to the island's worst chikungunya streets just before mosquito season. A sealed-lid rule on that grant costs a donor nothing, and it is worth more than every placement above combined.

Do not do this

CONTRAINDICATED · ADVICE THAT WOULD COST LIVES HERE

Advice that circulates for this hazard and would cost lives here.

Tell older people to avoid fans and take cool showers in the heat *

CONTRAINDICATED

Advice to avoid fans above 35°C circulates widely. Modelling for humid heat found fans were not harmful below 38°C for healthy adults over 65, or 37°C for those on anticholinergic drugs (Morris et al., *Lancet Planetary Health* 2021). West-coast summer highs here run about 29–34°C. Telling people to switch fans off removes the one cooling most of them have. "Take a cool shower" fails on the hours the taps are off.

Instead: fans plus wetting the skin with a damp cloth (1–2 litres a day), drinking water, a visit to a cool room, and a medication review for people on anticholinergic drugs or diuretics.

Make fogging the visible response to mosquitoes

CONTRAINDICATED

A systematic review found no randomised trial of outdoor space-spraying against dengue. Residents of Roches-Brunes and Stanley have asked for fumigation, and the Ministry of Health fogs routinely. In Réunion, *Ae. albopictus* developed resistance to deltamethrin, confirmed in 2017; Mauritius has not tested for it. Fogging reassures and takes staff from the container work that has trial evidence.

* Suggested formulation: check with a health worker before sharing.

Instead: put the vector teams on action 1. Keep fogging for confirmed case clusters, and test local mosquitoes for resistance first.

Run the rationing response on open drums, buckets, and basins

CONTRAINDICATED

Where supply is intermittent, household storage is the main *Aedes* habitat; in Kandy, Sri Lanka, 51% of positive containers were storage tanks and barrels. Commercial tanks are normally closed. The danger is the improvised store: the open drum, the bucket, the unscreened overflow. A rationing plan with no lid, mesh, or larvicide in it is a mosquito plan.

Instead: pair every storage message and every grant tank with a lid, screened vents and overflows, and a weekly scrub. Use larvicide where a container cannot be sealed.*

Call this season an "El Niño drought"

CONTRAINDICATED

MMS forecasts near-normal rain for October–December. The worst recent droughts (1998–99, ONI −1.5; 2011–12, ONI −0.9) came in La Niña years, and the last El Niño summer (2023–24, ONI +1.8) was wet. Drought framing prepares people for dry heat and leaves them unready for the cloudburst that kills.

Instead: one message from December to April: "store water safely; stay out of underpasses and ravines in heavy rain".

Surge-pump coastal boreholes on the west coast without measuring salinity

CONTRAINDICATED

A 2025 University of Mauritius resistivity survey found brackish layers beneath Flic en Flac and Albion (about 3,600–3,700 µS/cm), although the CWA borehole there still reads fresh. Emergency pumping lowers the water table, and an aquifer turned brackish takes years to recover. The evidence is one conference presentation, and national conductivity fell in 4 of 5 aquifers in 2010–21, so this is a precaution, not an observed collapse.

* Suggested formulation: check with a health worker before sharing.

Instead: pump inland boreholes first, publish monthly conductivity for each coastal well, and set a cut-off for each (action 7).

Send tankers only to people who can come and queue

CONTRAINDICATED

In June and October, tankers on the plateau served queues of people with buckets, and promised tankers did not arrive. In Cape Town and Chennai, emergency supply reached those best placed to collect it, and private tanker water cost 3–50 times as much as piped water. The 85-year-old at Carré-d'As will not be in the queue.

Instead: doorstep delivery for registered housebound households, and community tanks where supply fails first (action 4).

WHAT HAS HAPPENED HERE BEFORE — THE RECORD

YEAR	EVENT	TOLL	WHAT CHANGED AFTER
1867	Malaria epidemic, starting in Port Louis and spreading along the coast	About 40,000 deaths, roughly a tenth of the island's population (Seetah gives 41,000)	Movement to the plateau
1998–99 (La Niña)	Drought	Sugar crop about 340,000 t against 625,000 t potential	—
2006	Chikungunya epidemic	743 excess all-cause deaths in March–May; 91.5% aged 50 or over	Vector control expanded
2011–12 (La Niña)	Drought; MAV at 29%	Plaines Wilhems residents up at 3 a.m. to queue for tankers	Tank grant; private boreholes and river intakes brought in
2013 (neutral)	Port Louis flash flood, outside this zone	11 dead, most in an underpass and an underground car park	NDRRMC made permanent

* Suggested formulation: check with a health worker before sharing.

YEAR	EVENT	TOLL	WHAT CHANGED AFTER
Nov 2016	CWA takes over ENL's Telfair borehole	—	About 1,000 m³ a day added to the Rose Hill reservoir
Dec 2017 and Jan 2025	La Ferme the lowest reservoir in the island (29.6%, then 26.4%)	—	Treated as irrigation, not the west's supply
2023–24 (El Niño, wet)	Dengue outbreak, DENV-2; cases in Tamarin and Rivière Noire	3,311 cases on the main island and 1,363 on Rodrigues, with 4 deaths, to 19 March 2024 (WHO AFRO); then about 7,177 cases and 15 deaths nationally by 28 April (TravelHealthPro, secondary). The government's own figure is 6,673 cases and 8 deaths (June 2024)	WHO supplied 25,000 rapid tests
Jan 2024	Cyclone Belal	1 dead in Mauritius, on a flooded road	MMS director resigned
Dec 2025	Carré-d'As, Rivière Noire: 56 squatter families with reservoirs "often empty"	None recorded	Nothing found
May 2026	Chikungunya hotspots in Quatre Bornes, Rose Hill, Stanley, Trèfles, Camp-Levieux, Bambous	2,258 cases nationally by 4 May; 6,891 confirmed cases by 28 August 2026, mostly mid-April to early May (the 12 July count of 6,675 included 92 on Rodrigues); no deaths reported	Larviciding, sterile-male releases
Jun 2026	CWA communiqué of 15 June, effective 17 June: Quatre Bornes, Beau Bassin, Rose Hill, part of Black River put on 6 hours a day (MAV at 45%)	—	Tanker priority for hospitals, homes, schools, and prisons
8 Oct 2026	Water protests in Camp-Levieux	Three arrests	Cabinet's 9 October package

* Suggested formulation: check with a health worker before sharing.

The recurrence nobody has noticed: the epidemics here kill in March to May, after the rains return, not at the dry peak. Malaria in 1867 and chikungunya in 2006 both did, 139 years apart. The drums and tanks filled during this rationing will still be standing in March 2027. La Ferme, the west's own reservoir, has been the lowest in the island in every recent dry spell, and no water-supply plan treats it as the west's lifeline because it is classed as irrigation.

WHERE THE EXPERTS DISAGREE — UNRESOLVED

- **More household storage** (Historian, Emergency manager, and the government's grant) versus **storage as breeding sites** (Skeptic, Philanthropist). Both hold in the outbreak streets more than anywhere. The reconciliation is closed storage only, with a lid rule on the grant.
- **Heat as a killer here** (Public health, Emergency manager) versus **no local evidence** (verifiers). There is no Mauritian heat-mortality study and no MMS heat-warning criterion. Action 3 is ranked third, not first, for that reason, and its death-count step is what would settle the question for next year.
- **Cash for the poorest Black River households** (Philanthropist, Food supply chain) versus **duplication** (funding verifier). Social Register households already get Rs 3,000 a month, and the proposed recipients have never paid cash. It was dropped from the envelope.
- **Earmark the €3-a-night tourist fee** for this zone's water (Economist) versus **no earmark exists** (financial verifier). The fee is general revenue of about Rs 2bn a year. Earmarking needs a Cabinet decision and is not counted here.
- **Food**: the food-supply lens found the El Niño signal weak, with food inflation (6.2% in September 2026) driven by oil, freight, and shipping. Its sharpest point: after a cyclone, hotels and wholesalers with cold rooms restock first, and the Bambous shop that sells on credit restocks last, at the new price. Its proposals (a hotel procurement compact, dry-ration packs, water for the Quatre Bornes foire on market days) were not verified and are not ranked.

WHAT NOBODY COVERED — BLIND SPOT

Nobody could say what the supply schedule in this zone actually is today. The communiqué of 15 June, effective 17 June, set 6 hours a day; residents describe low pressure and night supply; and the 9 October press notice that moved the plateau to every other day says nothing about MAV Lower. Every water action here depends on that schedule. CWA should publish it by locality before anything else in this briefing is costed.

* Suggested formulation: check with a health worker before sharing.

HOW TO READ THIS METHOD

The panel is author-built. Eight simulated expert lenses were used to generate these recommendations. Where they agree, that is a strong hypothesis, not a consensus of the field. Every recommendation was then independently checked for evidence, transferability to this location, and feasibility before the peak; the verdict tags carry the result.

Mortality figures are resolved at Climate Impact Lab impact-region scale: this zone straddles two regions, of about 447,000 and 850,000 people. They are not neighbourhood figures, and none is published for Mauritius. The El Niño projection covers *heat only*; drought, flood, fire, smoke, and crop failure are additional to it and are carried here by the historical record rather than by a published number.

HOW THIS BRIEFING WAS PRODUCED METHODOLOGY

- **Scope.** The location was taken as the Central Water Authority's MAV Lower supply zone, one of six CWA-aligned briefings agreed for Mauritius on 13 October 2026. Climate Impact Lab impact regions: the Impact Map boundary file holds three for Mauritius, and this zone straddles two of them. Beau Bassin-Rose Hill, Quatre Bornes, and Ebène (Plaines Wilhems) fall in MUS.Rb4955ae83edc3e08 (label unconfirmed; Port Louis and Plaines Wilhems districts, about 447,000 people). The Black River coast falls in MUS.R8e39d7d595d97ac3 (label unconfirmed; the rest of the main island plus Rodrigues, about 850,000 people). The third, MUS.6, is Agaléga. Mortality figures exist only at region scale, and the Climate Impact Lab still publishes none for Mauritius; sub-city detail is used for hazard exposure and action design, not for death counts.
- **Exposure.** Climate Impact Lab, *451,000 at Risk* (September 2026, pre-peer-review): ECMWF SEAS5 seasonal forecasts (51-member ensemble) applied to temperature–mortality relationships across 24,378 regions, against a 1996–2025 baseline, for June 2026 – February 2027. It covers heat only, and it publishes no figure for Mauritius. Heat matters more here than on the plateau, but no number has been scaled down from another country. It is never added to the Impact Map's long-run projections or quoted from the map's GDP-denominated mortality.
- **Expert panel.** Eight simulated expert lenses (emergency manager, public health scientist, frontline responder, skeptic, economist, historian, philanthropist, and food supply chain analyst) each researched this place independently and in parallel, from web sources, to a fixed brief. They worked from the national evidence pack built for the MAV Upper briefing the same day, and re-verified only what is local.
- **Reconciliation.** Duplicate actions were merged and backing lenses recorded. Convergence was tested for shared bias (whether the evidence behind an agreed action came from a setting like this one) before it counted in an action's favour. Contradictions were kept, not resolved by

* Suggested formulation: check with a health worker before sharing.

dropping a side. Actions were ranked by expected lives saved per unit of effort before the peak, each was given a named payer and trigger or marked unfunded, and the funding placements were reconciled against the ranked list. Money for Victoria Hospital and for clinic readiness was assigned to one briefing each, so the two MAV briefings do not double-count it.

- **Verification.** Four separate verifier agents checked every recommendation on three tests: evidence (the primary source and its effect size), transferability (whether that evidence came from somewhere like here), and feasibility (whether it can be done here before the peak). Financial and regulatory actions were also checked for availability in this jurisdiction, a named payer, a trigger threshold, and whether they already exist. The funding envelope was checked for real recipients, published unit costs, and duplication, then re-summed.
- **Who does what.** The RACI chart is built from the owners named in the verified actions, with one accountable party per action. It is a proposal: no organisation named in it has been contacted or has agreed to a role.
- **Verdicts.** *Confirmed*: evidence, transferability, and feasibility all hold. *Partially confirmed*: holds after the corrections shown. *Unverified*: could not be checked to a primary source. *Contraindicated*: would do harm or waste the window here.
- **Adaptation Inventory.** Consulted by reading the dataset embedded in the inventory page (96 entries). It holds no Mauritius entries and none on vector control, water rationing, or flash-flood warning. The heat action has general precedents there (heat warning systems in Italy, Canada, and the US); every other action is tagged "no entry", meaning no matching precedent was found, not that the action is unprecedented.
- **Health wording.** Passages where a wording error could hurt someone (larvicide in stored water, cooling older people and fans, drinking water, and medicines in the heat) are marked "* Suggested formulation: check with a health worker before sharing." They were checked against published sources, not by a health professional. They are suggestions, not medical advice, and anyone passing them on should confirm them with a doctor, pharmacist, nurse, or community health worker first. The marker was added on 2 November 2026.
- **Rules.** No cost is derived by dividing a published total, and no local figure is invented; where data is thin, the report says so and shows the containing geography's number with its arithmetic. Every source is listed below with its verification status.
- **Limits.** The panel and verifiers are AI research agents working from web-available sources, not human experts, and no one in this place was interviewed. No current MAV Lower supply schedule was found. Several AllAfrica pages returned 403 and were read from search snippets. Coordinates for the Tamarin fishers' house and Carré-d'As are not in OpenStreetMap, so neither is mapped as a point. The tank grant's terms come from press and retailer accounts, not the scheme rules.
- **Revision.** Revised 2026-10-14 after the set audit (fixes applied: 1 impact regions; 3 Rs 600 covers unit, labelled an assumption; 4 the four cards shared with other zones linked to one national record in the map data; 5 all US$ figures restated at Rs 48.1061, MRA week 41; 6

dengue two-stage wording; 7 chikungunya 6,891 by 28 August; 8 communiqué of 15 June, effective 17 June; 9 MMS bulletin of 10 August; 10 La Ferme 42.5% on 29 September, the 1867 toll, the voucher, and the population basis; 33 unverified placement in the banner; 34 Ebène scope line; 35 three arrests and the Kandy source). The envelope in rupees is unchanged; fix 2 removed no money here because this zone carried no trigger-cash placement.
