EL NIÑO ACTION BRIEFING · 14 OCTOBER 2026

West (TCO), Réunion

Not an El Niño drought: a record carried-over water deficit, leaking networks, heat, mosquito-borne disease bred in stored water, leptospirosis, and cyclones that become water outages, in a hot El Niño year. Here, the first job is to reach the people who will not come to a shelter, and to stop the Le Port aquifer being pumped into salt.

IMPACT REGION	EXCESS HEAT DEATHS	WINDOW	DOMINANT HAZARD
All Réunion (one region); figure for the Saint-Paul arrondissement	1 (Réunion: 5)	6-month, Sep 2026 – Feb 2027	Cyclone deaths outside shelters; water cuts on a salting aquifer; dengue

20/20 recommendations checked. 0 confirmed as written, 11 corrected, 0 unverified; 9 contraindicated (the *Do not* cards). The funding target held at the panel's €577,000: verification changed its evidence (the cover line now rests on Girardot, Colombia, not Camino Verde) and its delivery route (outreach staffed through the Saint-Paul CCAS), not its size. Exposure: Climate Impact Lab, *451,000 at Risk*, Sep 2026, pre-peer-review, heat only; its own published row for the arrondissement of Saint-Paul, which is the five TCO communes including Mafate. Taking Mafate's 900 people out leaves it at about 1. That subtraction is our arithmetic.

EXECUTIVE SUMMARY — AT A GLANCE

21.05°S 55.30°E, France · IGN ADMIN EXPRESS, OpenStreetMap contributors; Natural Earth

- **The risk.** Belal killed a rough sleeper at Saint-Gilles and Garance two people in Trois-Bassins and Saint-Paul; Le Port and La Possession are on alerte renforcée with salt entering the aquifer.
- **First action.** By 30 November the Saint-Paul CCAS lists rough sleepers by name, and a worker each one knows walks them in at alerte orange.
- **The money.** €307k / €577k / €1.10M (floor / target / ceiling). The €65k outreach line saves the most lives per euro.
- **Do not.** Never pump the Le Port aquifer past its salinity line to keep taps running: a salted aquifer takes years to recover.

* Suggested formulation: check with a health worker before sharing.

TCO (Territoire de la Côte Ouest, now branded "Territoire de l'Ouest") is Le Port, La Possession, Saint-Paul, Les Trois-Bassins, and Saint-Leu, on Réunion's dry leeward coast: 222,009 people (INSEE, populations légales 2023, in force 2026), 87,631 households, and a 32.2% poverty rate (INSEE, 2023); Le Port's rate is 43–44%. **This briefing covers TCO without Mafate**, whose about 900 people (TCO, 2025) and îlets are in the cirques briefing: about 221,100 people. TCO holds the drinking-water competence, with a different operator in almost every commune. It has 16 of Réunion's 57 priority neighbourhoods (QPV): 11 in Saint-Paul, 2 in Saint-Leu, 1 in Le Port, and 2 shared by Le Port and La Possession. This is the fifth of six Réunion briefings, written to be adopted as an annex to TCO's intercommunal safeguard plan (PICS), *volet pénurie d'eau, chaleur et épidémies*. Each action carries its cyclone phase (avant, pendant, or sauvegarde).

COMMUNE	WATER OPERATOR	VIGIEAU, GROUNDWATER / DRINKING WATER (14 OCT 2026)	NETWORK EFFICIENCY (2021)
Le Port	Runéo (delegated, from 2022)	Alerte renforcée / alerte renforcée	80% (Grenelle target 85%)
La Possession	SEMOP Eaux de la Possession (51% Runéo; to about March 2028)	Alerte renforcée / alerte renforcée	63% (target 81%)
Saint-Paul	La Créole (TCO régie)	Alerte / alerte	61% (target 78%)
Les Trois-Bassins	La Créole (TCO régie)	Vigilance / vigilance	54% (target 68%)
Saint-Leu	Derichebourg Aqua OI (delegated)	Vigilance / vigilance	50% (target 75%)

VigiEau shows the restriction level, not the state of supply: prefectoral order of 9 October 2026, in force 10 October; surface water is at vigilance in all five. Efficiency: Office de l'eau, *Chroniques de l'eau* n°133 (2023), 2021 data; no TCO commune meets its target, and Saint-Leu loses half its water. Le Port and Saint-Leu operators come from TCO and SISPEA records, not from the award decisions. The new Port–Possession plant (8,000 to 25,000 m³ a day, €19.3M) enters service only in early 2028. Météo-France expects El Niño to bring Réunion rain that is on average in surplus, a clearly hotter season, and no change in cyclone exposure. The deficit comes from before this El Niño: 2025–26 was the driest rainy season in 54 years of records (−45%, provisional; −60 to −70% in the hauts), the second deficit season in a row after −30% in

* Suggested formulation: check with a health worker before sharing.

2024–25 (Météo-France, provisional season review, 29 April 2026), and Saint-Paul, Le Port, and La Possession have been under restrictions since 25 February 2026.

WHAT THIS PLACE SHOULD DO RANKED

Ranked by expected lives saved per unit of effort before the peak. Backing lenses are shown per action; an action several lenses reached independently is the stronger bet.

1. By 30 November, list by name where people sleep rough in Saint-Gilles, Saint-Paul, Le Port, and Saint-Leu, and have a worker each person knows walk them in at alerte orange

PARTIALLY CONFIRMED | PHASE: AVANT | FRONTLINE · EMERGENCY MANAGER · PUBLIC HEALTH · SKEPTIC · HISTORIAN · PHILANTHROPIST | ADAPTATION INVENTORY: NONE FOUND

OWNER	BY WHEN	COST	PREVENTS
CCAS of Saint-Paul, with Le Port's CCAS and Secours Catholique (Saint-Leu)	List by 30 November 2026; pickup at each alerte orange	€65,000 (F01)	Deaths of people who will not walk into a shelter

TCO's only cyclone death in Belal was a homeless man found near the Saint-Gilles gendarmerie on 14–15 January 2024, as Belal struck on the 15th. Réunion La 1ère reported that the Saint-Gilles man had refused shelter (a place in Saint-Paul); the Interior Minister said others "auraient refusé" (conditional). During the violet alert 158 shelters were open across the island, and only 636 people were in them (Outremers360; Reporterre gives "a little over 600" in 161). Every lens reached the same conclusion: the plan assumed people would come once a shelter opened, and they did not. The list records, for each person, their name, where they sleep (Saint-Gilles beach and marina, the Saint-Paul seafront, Le Port, the Saint-Leu seafront), and what makes them refuse. It then names a nearby place each one will accept. At pré-alerte, someone they already know offers it. At orange, that person walks them in, rather than a stranger at red. The services exist. The Saint-Paul CCAS runs a year-round day centre, gives a postal address to about 600 people, and has 12 social workers across 17 local offices (Saint-Paul, *Sinpol Mag* n°3, May 2025). In Saint-Leu, Secours Catholique opened the Leu Kazanou day centre on 2 February 2026; it counts about 40 homeless people in the commune, and Médecins du Monde holds a Monday-evening session there. Cost: 2 outreach workers × 5 months × €3,500 (an estimate) + 300 kits × €50 + a €10,000 reserve + €5,000 to Secours Catholique.

* Suggested formulation: check with a health worker before sharing.

Corrections: the body was found on 14–15 January (sources differ by a day), not on the 15th alone. The refusal rests on La 1ère's own reporting; the préfet is not quoted, and the minister's line on others is conditional. No street-outreach team was found in Le Port or Saint-Gilles, and no SIAO (115) round in the West. So the two posts should be staffed from the Saint-Paul CCAS day-centre team, not hired new, or they will not be in place by 30 November. Saint-Leu's Monday seafront round has moved indoors. No source shows that Réunion shelters refuse dogs. Treat pets and belongings as a reason to ask each person, not as a documented barrier.

2. From November, run breeding-site and water-cover rounds in Saint-Leu, Saint-Paul, La Possession, and Le Port, and print "couvrez vos réserves" on every TCO water-cut notice

PARTIALLY CONFIRMED | PHASE: AVANT | PUBLIC HEALTH · FRONTLINE · SKEPTIC · PHILANTHROPIST · ECONOMIST | ADAPTATION INVENTORY: NONE FOUND

OWNER	BY WHEN	COST	PREVENTS
The communes, with TCO, the water operators, and neighbourhood associations; ARS vector control consulted	**Rounds 2 Nov – 15 Dec 2026, then monthly**	**€195,000: covers for 15,000 households at €13 delivered (F03)**	**A second dengue wave, now with DENV2, bred in water stored during cuts**

The west coast carried Réunion's dengue this year. Saint-Leu had a cluster of more than 30 cases by 22 May, and Saint-Paul had cases "à divers endroits de la commune". DENV2 was first detected in La Possession, and by July it made up 30% of 203 samples analysed (Santé publique France, 22 May and 10 July 2026). Cases are now sporadic: 347 for the year, and 7 in weeks 36–38. So this is pre-season work, before the rains and the heat. Each visit removes breeding sites in the yard (saucers, tyres, small containers, gutters), fits a cover to stored water, and gives one line on leptospirosis. Restrictions in Le Port and La Possession make households store water, so those two communes are included even without a cluster. Every TCO and operator cut notice carries the island line RE-01. The best trial is Camino Verde (Andersson et al., *BMJ* 2015): community-led clearance cut recent infection in children by 29.5% (95% CI 3.8–55.3) and houses with larvae by 44%.

Corrections: the panel's quartier names for Saint-Paul (L'Hermitage, Roches Noires, Grand Fond, Saint-Gilles) are not in any 2026 bulletin and are dropped. The ARS already treats around confirmed cases and is funded for it, so the communes are accountable and the ARS is consulted. **Transferability:** Camino Verde studied *Ae. aegypti* in Nicaragua and Mexico. Réunion's *Ae. albopictus* breeds mainly in small

* Suggested formulation: check with a health worker before sharing.

discarded containers and in ravine rock holes (Delatte et al. 2008), so covers do only part of the job, and the round must clear containers too. The €13 cover has no Réunion quote.

3. By 30 November, enrol isolated older people, disabled people, and home-dialysis and oxygen patients in each commune's census of vulnerable people, and give each a named neighbour who checks on them

PARTIALLY CONFIRMED | PHASE: AVANT | PUBLIC HEALTH · FRONTLINE · PHILANTHROPIST

ADAPTATION INVENTORY: HEAT WARNING SYSTEMS (ITALY, US, CANADA), NOT IN A SETTING LIKE THIS

OWNER	BY WHEN	COST	PREVENTS
The five mayors, through their CCAS, with neighbourhood associations	30 November 2026	€52,500: three coordinators for 5 months (F02)	Deaths of people with chronic illness during water cuts, power cuts, and heat

The neighbour checks at alerte rouge, on day 2 of a water cut, and on hot days. Saint-Paul's CCAS already runs a *recensement des personnes vulnérables*, "pour une réponse rapide en cas de déclenchement du plan d'alerte et d'urgence (cyclone, canicule, crise sanitaire…)". This action extends it and builds the same in the other four communes, starting in Le Port, Trois-Bassins, and the Saint-Paul hauts. 13.6% of Réunion adults have diagnosed diabetes (SPF, 2021). Réunion's dialysis need is five times the national rate, and end-stage kidney failure three to four times as prevalent (Senate report r25-554); those patients need water and power, and their sessions are brought forward at the pré-alerte. Most of the 45 chikungunya deaths of 2024–25 were older people with several chronic illnesses. There is no Météo-France heat warning in Réunion, so the plan names its own hot-day trigger. Three coordinators: Le Port and La Possession, Saint-Paul, and Saint-Leu and Trois-Bassins.

* Suggested formulation: check with a health worker before sharing.

Corrections: the mayor's register (CASF L121-6-1) covers people aged 65 and over, people over 60 unable to work, and disabled adults, on request only. Keep under-65s with diabetes on a separate consented list. The kidney figures are the Senate's (r25-554), which the whole Réunion set uses; the earlier REIN (2018) prevalence ratio is dropped. **Evidence is indirect:** France's 2006 heatwave killed about 4,400 fewer people than predicted after the post-2003 heat plan (Fouillet et al. 2008), but the authors do not show cause, and no buddy scheme has been trialled on its own, or on a humid tropical island.

4. By 30 November, name drinking-water distribution points by quartier, starting with the hauts of Saint-Paul, and sign a call-off contract for water packs paid only when triggered

PARTIALLY CONFIRMED | PHASE: SAUVEGARDE | EMERGENCY MANAGER · ECONOMIST · HISTORIAN · SKEPTIC | ADAPTATION INVENTORY: NONE FOUND

OWNER	BY WHEN	COST	PREVENTS
TCO, with La Créole, the SEMOP Eaux de la Possession, Runéo (Le Port), and Derichebourg (Saint-Leu)	**30 November 2026; released at the trigger**	**About €45,000 per event, released on the trigger (TCO water budget; estimate)**	**Day-3-to-day-7 harm in a Garance-type outage**

Garance left more than 310,000 people on Réunion without drinking water, about twice the number without power, while about 953 were in shelters: the water cut was the real event. In the West, the hauts and outlying hamlets of Saint-Paul are cut first. About 100 residents protested over repeated cuts on 8 April 2026. After Batsirai (February 2022), Saint-Paul and La Créole had to ration bottled water to 5 litres a family so that stock would not run out. So name the distribution points now, hauts and écarts first, then Le Port and La Possession. Before the season, sign a framework contract with call-off orders (*accord-cadre à bons de commande*, Code de la commande publique R2162-2), paid only if used. Trigger: alerte rouge, or any distribution unit cut for more than 24 hours. Cost arithmetic: 10,000 vulnerable people × 3 L a day × 3 days × €0.50 a litre = €45,000.

* Suggested formulation: check with a health worker before sharing.

Corrections: no public source shows whether TCO already holds such a contract. TCO's 2026 water budget is €17.8M, but €16.2M of it is investment and only about €0.2M is running costs, with no drought or cyclone line, so €45,000 per event is a real decision for TCO, not loose change. No published rotating-cut schedule (*tours d'eau*) was found for TCO, only recurring cuts. €0.50 a litre is the set's estimate (Mayotte 2023 retail as proxy).

5. Before December, top up the Rivière des Galets bank at épi 5 above Le Port, and agree to move the homes behind it at alerte orange, not on a river reading

PARTIALLY CONFIRMED | PHASE: AVANT | HISTORIAN | ADAPTATION INVENTORY: NONE FOUND

OWNER	BY WHEN	COST	PREVENTS
TCO (flood-defence competence, GEMAPI), with the commune of Le Port and the Préfecture	**30 November 2026**	**Existing GEMAPI works budget**	**A breach behind the épis catching the Rivière des Galets quartier occupied**

The right bank of the Rivière des Galets between épis 4 and 5 has had "multiples effondrements avec réparations d'urgence systématiques" since 2007, and the dike there sagged in Gamède (2007, an El Niño year). In Belal (2024, El Niño), the river peaked at 1,012 m³/s, undercut the bank, and carried off at least 145 blocks. In Garance it peaked at 853 m³/s and went round épi 5 from upstream. The riverbed now sits 2 m above the épi's foundation (TCO deliberation of 1 June 2026). The works behind the épis protect the urbanised middle reach, which BRL (2021) calls the Rivière des Galets quartier of Le Port. BRL rates the bank between épis 4 and 5 at a 5% chance of failure in a 100-year flood (3,400 m³/s). Before the season, inspect and top up the provisional fill. With the Préfecture and the commune, agree to pre-evacuate the homes behind it at alerte orange.

* Suggested formulation: check with a health worker before sharing.

Corrections: épi 4 and the 4–5 bank are scheduled for 2026 (€4.23M excluding tax, plus €0.24M of studies), and épi 5 for 2027 (€2.6M); the programme totals €7.07M excluding tax, and TCO asks the State's post-Garance Pacte d'Avenir for €6.41M of it (TCO deliberation 2026_015_BC_15, 1 June 2026). The deliberation does not say the provisional fills "held". A flow trigger is weak: the only gauges are at the intake dams upstream, and Vigicrues Réunion is suspended in red and violet cyclone alerts (see *Do not* 9). The figure of about 22,000 people protected by the whole system was seen only in a search summary and is not used.

6. By 15 December, walk the PPR landslide and ravine zones of Trois-Bassins and Saint-Leu and list the homes to move at alerte orange; within 24 hours of every all-clear, check basins and ravines against the lists

PARTIALLY CONFIRMED | PHASE: SAUVEGARDE | EMERGENCY MANAGER · HISTORIAN | ADAPTATION INVENTORY: NONE FOUND

OWNER	BY WHEN	COST	PREVENTS
The mayors of Trois-Bassins and Saint-Leu (with the municipal police and ONF); all five communes and the gendarmerie for the sweep	15 December 2026	Staff time	The two kinds of death Garance caused in TCO

Garance (28 February 2025) killed a woman buried by a mudslide in Trois-Bassins. A man reported missing in Saint-Paul was found days later, on about 3 March, at Ravine Bassin, by municipal workers clearing a basin; the cause was not given. The first death argues for a walk list of homes on slopes and ravine edges, moved at orange. The second argues for a search of basins and ravines within 24 hours of the all-clear, against the CCAS lists, rather than waiting for clean-up crews.

* Suggested formulation: check with a health worker before sharing.

Corrections: the panel said these communes have no risk map. They are outside the TRI flood map (Saint-Paul is the only TCO commune confirmed in it), but both have approved risk-prevention plans for floods and landslides (PPRN: Trois-Bassins 2013, Saint-Leu 2015) and coastal plans (2019). The walk lists should start from those zones. One source places the Saint-Paul body at "Bassin Vital"; the prefecture said "Ravine Bassin".

7. By 25 November, the TCO president and the five mayors sign TCO's intercommunal safeguard plan with this water, heat, and epidemics annex and the cirques annex for Mafate

PARTIALLY CONFIRMED | PHASE: AVANT | EMERGENCY MANAGER · ECONOMIST · FOOD SUPPLY | ADAPTATION INVENTORY: NONE FOUND

OWNER	BY WHEN	COST	PREVENTS
The president of TCO, with the five mayors	By 25 November 2026 (legal deadline 26 November, AMF)	Staff time; no new money	Actions 1–6 and 9 staying voluntary when the alert comes

Under the loi Matras (2021-1520) and décret 2022-907, TCO must have an intercommunal safeguard plan (PICS): by 25 November 2026 (legal deadline 26 November, AMF), co-adopted by the EPCI president and each mayor with a PCS. Writing this annex into it turns the other actions into assigned duties, with their triggers: the VigiEau level, alerte orange and rouge, and a distribution unit cut for more than 24 hours. The plan should also carry the cirques annex for Mafate (the cirques briefing, action 4) and a short food page: shops with generators, cold rooms in Le Port, and a priority lorry route out of the port when it reopens.

* Suggested formulation: check with a health worker before sharing.

Corrections: the plan is signed (*arrêté*) by the EPCI president and by each mayor, not by the president alone. The legal deadline is 26 November (AMF); local deliberations give 25 or 26, so aim for 25. No public record shows whether TCO's PICS has been adopted or started; ask TCO. The claim that Saint-Paul's commune plan names Mafate shelter centres could not be checked and is not repeated here.

8. Before January, publish a salinity limit for the Le Port and La Possession drinking-water boreholes, and decide in writing that delivered water replaces pumping past it

PARTIALLY CONFIRMED | PHASE: AVANT | SKEPTIC · ECONOMIST | ADAPTATION INVENTORY: NONE FOUND

OWNER	BY WHEN	COST	PREVENTS
The Préfecture (drought framework), with TCO, Runéo and the SEMOP, the Office de l'eau, and the ARS	31 December 2026	Staff time; delivered water from action 4	Losing Le Port's aquifer to salt for years, for a few weeks of uninterrupted taps

The BRGM found in 2011 that "des intrusions salines sont déjà réelles au niveau du secteur Le Port", with the brackish lower aquifer rising "suite à l'exploitation de la nappe moyenne" (report RP-59457-FR). In spring 2026 the préfet reported that conductivity "dans plusieurs nappes de l'Ouest" had reached "seuils préoccupants, signes d'intrusion d'eaux salées", naming Le Port's aquifer, and that critical thresholds "ne doivent pas être franchis". The drought framework already sets water-level thresholds for the Plaine des Galets boreholes, but it sets **no conductivity limit and no rule to stop drinking-water pumping**. The BRGM's own classes give a starting point: above 1,000 µS/cm, a borehole is suspected of saltwater influence. Publish the limit and the readings. Write down now, before January, that past the limit pumping stops and the vulnerable get delivered water (action 4). Nobody will want to make that call in the middle of a cut.

* Suggested formulation: check with a health worker before sharing.

Corrections: the action is partly in place (water-level triggers exist), so it adds a conductivity trigger rather than a new system. The number of the framework order in force could not be confirmed from the draft read. The new Port–Possession plant will not ease this before early 2028.

9. By 30 November, stock 2,500 water-storage kits and 2,000 no-cook food kits, released at pré-alerte or alerte orange before a forecast or announced cut, and have the five CCAS ready the lists for the island trigger-cash line

PARTIALLY CONFIRMED | PHASE: PENDANT | FOOD SUPPLY · PHILANTHROPIST · ECONOMIST · EMERGENCY MANAGER

ADAPTATION INVENTORY: ANTICIPATORY CASH (BANGLADESH, NEPAL) FOR THE CASH PART ONLY

OWNER	BY WHEN	COST	PREVENTS
The five CCAS (Le Port and La Possession first), with the Croix-Rouge / PIROI and the Banque alimentaire des Mascareignes	30 November 2026; released at pré-alerte or alerte orange, before the cut	€264,500: €212,500 water kits (F04) + €52,000 food kits (F05); cash from the island line RE-F01	Households with no safe water to drink or cook with after a cyclone

A water kit holds jerricans, purification tablets (Aquatabs), and a container cover, at the set cost of €85. The jerricans must be lidded, or the kit works against action 2. It is storage and treatment, not drinking-water supply. Kits go out at pré-alerte or alerte orange, before a forecast or announced cut: never at alerte rouge, which is lockdown, and never on a cut of more than 72 hours, because that is when the State's bottled water starts (ARS Garance review) and the kits would duplicate it. The food kit covers three days for a household at €26. Port Réunion, at Le Port, handles nearly all the island's goods; its activity stopped from the orange alert in Garance, and schools close from orange. After Belal the port reopened within three days. So food does not run out: what runs out is water, power, and the cash to buy in a shop with no generator. The five CCAS should also assemble now the documents the State's emergency relief will need, and the lists for the island trigger cash (€475 a household, RE-F01). These are the CCAS's own aid lists, kept separate from the mayor's register (CASF L121-6-1), which décret 2026-590 forbids using for cash. TCO has up to about 28,200 poor households (87,631 × 32.2%, an estimate: the rate is per person).

Corrections: PIROI's warehouse stock is regional (sent to Mayotte, the Comoros, and Madagascar), not earmarked for Réunion, so the kits must be bought in and owned by TCO's CCAS; phone PIROI before naming quantities. The Banque alimentaire distributes donated food through 11 CCAS and 30 associations, so assembling 2,000 bought kits is new work for it. Once shops reopen, cash beats food parcels; the

* Suggested formulation: check with a health worker before sharing.

food kits are for the first three days only. No Croix-Rouge water distribution on Réunion after Garance was found. The release trigger was moved to pré-alerte or orange after the set audit, for the reasons above.

10. Before the rains, brief west-coast GPs and the Saint-Paul hospital on severe-dengue warning signs as DENV2 spreads, and offer the most exposed in the West the free leptospirosis vaccine alongside prevention

PARTIALLY CONFIRMED | PHASE: AVANT | PUBLIC HEALTH · FRONTLINE | ADAPTATION INVENTORY: NONE FOUND

OWNER	BY WHEN	COST	PREVENTS
ARS La Réunion, with the Centre hospitalier Ouest Réunion (CHOR) and west-coast GPs	Briefing by 15 December 2026; ARS mobile vaccine sessions in the West from December	Within ARS and CHOR budgets	Severe dengue missed in people infected before; leptospirosis deaths after rain

The West is where a second dengue infection is most likely this summer: DENV1 circulated in 2026, DENV2 dominated in 2024 (1,356 cases, 5 deaths), and DENV2 is back, first detected in La Possession. A second infection with a different serotype can carry a higher risk of severe disease. In a Nicaraguan cohort the hazard was about 7.6 times higher, but only in people with a narrow band of pre-existing antibody (Katzelnick et al., *Science* 2017). The CHOR at Plaine Chabrier runs a 24-hour emergency department and SMUR for about 230,000 people from Saint-Leu to La Possession. A short refresher there and for GPs covers the warning signs and the triplex PCR (dengue, chikungunya, leptospirosis in one sample), which Santé publique France recommends for any dengue-like illness. Leptospirosis: the West had 32 of 207 cases (16%) from 1 January to 24 June 2026 (the latest West sector data), 17 in Saint-Paul and 11 in Saint-Leu. The vaccine has been free for all adults since 29 September 2025 (ARS and CGSS), with the most exposed prioritised. It is given at CHU Nord, CHU Sud, and occupational health services, so reaching the West means the ARS running mobile sessions. The schedule is two injections 15 days apart, a booster at 4–6 months, then every 2 years if exposure continues. Protection builds over the first month after two doses; it is not this season's main defence. For farmers, gardeners, and ravine workers it goes alongside prevention (boots, gloves, no wading) and early care for fever after rain (island card RE-X08).*

* Suggested formulation: check with a health worker before sharing.

Corrections: the 7.6-fold figure applies to one antibody band, not to all second infections. WHO says early care "greatly lowers" fatality and gives no current figure. 2026 has had 13 dengue hospitalisations and none severe (to July), so this is preparation, not a response. Leptospirosis is mainly a South and East disease (the West is about 14 per 100,000), so this ranks low.

11. Before December, have the Préfet ask the 2026 price-shield signatories for a 30-day hold on fresh produce after a red alert, and prepare the request for a government price decree in case they refuse

PARTIALLY CONFIRMED | PHASE: SAUVEGARDE | FOOD SUPPLY | ADAPTATION INVENTORY: NONE FOUND

OWNER	BY WHEN	COST	PREVENTS
Préfecture de La Réunion, with the price observatory (OPMR)	30 November 2026	Staff time	A Garance-sized fresh-price spike passing unchallenged

After Garance, fresh-product prices rose 19.1% in March 2025 and another 7.1% in April (INSEE Flash Réunion 291 and 292). The shock came from flattened local produce, not from imports: West-coast market gardens in Saint-Paul are what a cyclone breaks. The 2026 bouclier qualité-prix was signed on 27 May 2026 (175 items for €403). Ask its signatories now for a voluntary 30-day hold on about 20 fresh items, starting automatically when a red alert ends. Prepare the request for a government decree (Code de commerce L410-2) in case they refuse. Mayotte had one after Chido (décret 2024-1182).

Corrections: the panel thought no 2026 BQP was signed; it was (one source gives the date, so check reunion.gouv.fr). No precedent for a voluntary post-cyclone hold was found, so it is unproven. The INSEE flash is monthly and about four weeks late, so it can check the hold but not start it. The overseas cost-of-living bill passed the Senate without its crisis price-cap clause and has not been adopted. The El Niño food signal here is weak (prices −2.2% year on year in August 2026), and lives saved are indirect.

* Suggested formulation: check with a health worker before sharing.

WHO DOES WHAT

RACI CHART

R = Responsible (does the work) · **A** = Accountable (one per action; signs off and answers for it) · **C** = Consulted (asked before) · **I** = Informed (told after). Built from the owners named in the verified actions. No one here has been contacted or has agreed to a role; every row is a proposal. "Water operators" are La Créole, the SEMOP Eaux de la Possession, Runéo, and Derichebourg Aqua OI; "Associations" include Secours Catholique, the Croix-Rouge / PIROI, and the Banque alimentaire.

Action	ARS	TCO	Water operators	Communes	CCAS	Associations	Préfecture
1. Rough-sleeper list and pickup		I		C	A/R	R	I
2. Breeding-site and cover rounds	C	R	R	A/R	C	R	
3. Vulnerable census and neighbours	C			A	R	R	
4. Distribution points and water packs	C	A	R	R	C		C
5. Épi 5 and pre-evacuation		A/R		R	I		C
6. Slope lists and post-alert sweep		I		A/R	C		I
7. Sign the PICS annex	C	A/R	C	R	I		C
8. Aquifer salinity limit	C	R	R	I			A
9. Water and food kits; cash lists		C		I	A/R	R	I
10. Severe dengue and lepto vaccine	A/R			I	I	C	
11. Fresh-price hold				I		C	A/R

What the chart shows: the communes appear in every row and do the work in five, and the CCAS are accountable for the two rows that carry most of the donor money (1 and 9). TCO is accountable for three rows, and two of them need a decision rather than money: signing the PICS (7) and contracting the water packs (4). The Préfecture holds the hardest call, the salinity limit (8), which trades taps for an aquifer. No row depends on the State paying first.

WHERE MONEY DOES THE MOST

FUNDING

The Philanthropist lens, reconciled against the ranked actions and verified. Placements are ranked by marginal lives saved per dollar. The envelope is bounded by what this place can spend before the peak, not by what it needs.

FLOOR

€306,500 (about $343,000)

TARGET

€577,000 (about $646,000)

CEILING

€1,098,100 (about $1,229,000)

LARGEST UNCERTAINTY

Whether outreach can be staffed before December: no team exists outside Saint-Leu

At the ECB reference rate of 14 October 2026, €1 = US$1.1195, fixed for all six Réunion briefings. **Floor** = outreach €65,000 + coordinators €52,500 + covers for 8,000 households (€104,000) + 1,000 water kits (€85,000) = €306,500. **Target** = the same, with covers for 15,000

* Suggested formulation: check with a health worker before sharing.

households (€195,000), 2,500 water kits (€212,500), and 2,000 food kits (€52,000) = €577,000. **Ceiling** = covers for up to all 28,200 poor households (87,631 households × 32.2%, an estimate; €366,600; this count includes Mafate's roughly 300 households, which the cirques briefing also funds, so the overlap is noted here and the amount is unchanged), 6,000 water kits (€510,000), and 4,000 food kits (€104,000), plus the two fixed lines = €1,098,100. Above that, delivery capacity binds before the peak, not money. Unit costs are the set's (Decision 4); none has a Réunion quote. **Not counted here:** the island trigger-cash line RE-F01 (€475 a household; €475,000 / €950,000 / €1,623,075 for all of Réunion), and the water-pack contract in action 4 (about €45,000 per event), which is TCO's own budget. **Change in verification:** the target is unchanged from the panel's €577,000; the ceiling rose €1,300 when the household count was corrected (28,100 to 28,200). **Already funded, so not duplicated:** ARS vector control (about €15M in early 2025) and the door-to-door work around cases, the State's share of mosquito-control jobs, ORSEC shelters, the ARS leptospirosis vaccine, and FEDER network renewal. None of them pays for outreach to rough sleepers, covers, or kits.

RECIPIENT	USE	AMOUNT	MECHANISM	BASIS	VERDICT
CCAS of Saint-Paul (day-centre staff), with Le Port's CCAS; €5,000 to Secours Catholique, Leu Kazanou, Saint-Leu	Action 1: rough-sleeper list and escorted pickup	€65,000 ($72,768)	Direct grant; readiness	TCO's cyclone death in Belal was a rough sleeper. No published cost per life; 2 workers × 5 months × €3,500 + 300 kits × €50 + €10,000 reserve + €5,000 (estimates). The Saint-Paul CCAS budget is about €4.5M, so €65,000 is about 1.4%	PARTIALLY CONFIRMED
The five CCAS	Action 3: three census-and-neighbour coordinators	€52,500 ($58,774)	Top-up to an existing scheme; readiness	Extends Saint-Paul's existing census. Evidence indirect: France's post-2003 heat plan (Fouillet et al. 2008), not causal, temperate	PARTIALLY CONFIRMED

* Suggested formulation: check with a health worker before sharing.

RECIPIENT	USE	AMOUNT	MECHANISM	BASIS	VERDICT
Neighbourhood associations and the five CCAS, with ARS targeting	Action 2: covers for 15,000 households in the rounds	€195,000 ($218,303), target; floor / target / ceiling €104,000 / €195,000 / €366,600	Pre-positioned stock; readiness	Girardot, Colombia: treated covers plus community action at US$20.9 a household above routine control, with marginal extra effect, cost-effective only where dengue is common (Taborda et al. 2022); our €13 is goods and delivery only	PARTIALLY CONFIRMED
Croix-Rouge française / PIROI (Réunion warehouse), with the CCAS of Le Port and La Possession	Action 9: 2,500 lidded water-storage kits	€212,500 ($237,894), target; floor / target / ceiling €85,000 / €212,500 / €510,000	Pre-positioned stock; released at pré-alerte or alerte orange, before a forecast or announced cut	Set unit cost €85 (mainland retail goods plus freight, estimate); no cost-per-life figure. PIROI shipped more than 100 t after Chido, but its stock is regional and must be replaced	PARTIALLY CONFIRMED
Banque alimentaire des Mascareignes, through the five CCAS	Action 9: 2,000 three-day no-cook food kits	€52,000 ($58,214), target; floor / target / ceiling €0 / €52,000 / €104,000	Pre-positioned stock; released on the trigger	Set unit cost €26 (estimate). Kit assembly is new work for BAM; cash (RE-F01) replaces it once shops reopen	PARTIALLY CONFIRMED

The funder's one thing: the €65,000 for outreach is worth more than the last €300,000 of covers, and it is also the line most likely not to happen, because nobody in Le Port or Saint-Gilles is doing street outreach today. Sign it this month, pay by worker-month, and staff it from people the rough sleepers already know at the Saint-Paul day centre. Money that reaches a partner after mid-December is a donation to next season.

* Suggested formulation: check with a health worker before sharing.

Do not do this

CONTRAINDICATED · ADVICE THAT WOULD COST LIVES HERE

Advice that circulates for this hazard and would cost lives here. Cards 1–5 apply to every Réunion zone and are written once for the island (RE-X01 to RE-X05). Cards 7 and 8 are the West's versions of island cards RE-X07 and RE-X06; cards 6 and 9 are specific to the West.

1. Do not call this season an "El Niño drought"

CONTRAINDICATED ISLAND-WIDE (RE-X01)

Météo-France expects El Niño to bring Réunion rain that is on average in surplus. The shortage is a carried-over deficit and leaking networks; Saint-Leu loses half its water. A drought message tells people to expect less rain, when the risks are heavy rain on dry slopes, ravine floods, leptospirosis, and mosquitoes breeding in stored water.

Instead: use the premise: a record carried-over deficit and leaking networks, in a hot El Niño year in which rain, when it comes, brings its own dangers.

2. Do not make insecticide fogging the visible response to dengue or chikungunya

CONTRAINDICATED ISLAND-WIDE (RE-X02)

Deltamethrin has been used on Réunion since 2006, and resistance in *Ae. albopictus* was detected in 2017. The ARS already limits spraying to the area around cases "to avoid creating resistance". Fogging streets looks like action and leaves the breeding sites in place.

Instead: keep spraying to the ARS's case-centred use, and put the visible effort into door-to-door clearance (action 2).

3. Do not tell households to "store water" without saying "covered, emptied and scrubbed weekly"

CONTRAINDICATED ISLAND-WIDE (RE-X03)

Every restriction notice in Le Port and La Possession makes households fill drums and buckets, just as the hot, wet season starts. During the Mayotte water crisis of 2023, ARS teams found 413 breeding sites in 1,551 homes visited.

* Suggested formulation: check with a health worker before sharing.

Instead: "Couvrez vos réserves (couvercle ou moustiquaire), videz-les et frottez-les chaque semaine", on every water-cut notice (RE-01).

4. Do not push chikungunya vaccination with Ixchiq for people aged 65 and over, or put chikungunya vaccine stock ahead of dengue and leptospirosis

`CONTRAINDICATED` `ISLAND-WIDE (RE-X04)`

The HAS advised suspending Ixchiq for people aged 65 and over on 25 April 2025, after serious adverse events in older people, most of them on Réunion; since June–July 2026 the EU has also restricted it. The HAS estimates 66% of Réunion's population now carries chikungunya antibodies and judges a new epidemic "peu probable". In the West the live threat is DENV2.

Instead: follow the HAS (24 April 2026): Vimkunya for people aged 65 and over and for 12–64-year-olds with comorbidities, only if an epidemic resumes. Spend the effort on dengue and leptospirosis (actions 2 and 10).*

5. Do not let tanker water be taken as drinking water

`CONTRAINDICATED` `ISLAND-WIDE (RE-X05)`

In the January 2025 drought, the ARS recorded 8 distribution units on tankers marked "non alimentaire", serving 36,240 people. After Garance, even restored tap water was to be boiled or not drunk for a period.

Instead: label every tanker "non potable" in French and Creole, and hand out drinking-water packs at the same point (action 4).*

6. Do not pump the Le Port and La Possession aquifer past its salinity line to keep taps running

`CONTRAINDICATED` `WEST (TCO)`

The BRGM ties the salt already present under Le Port directly to pumping the middle aquifer, and the préfet reported conductivity at "seuils préoccupants" in spring 2026. Seawater that has entered an aquifer takes years to flush out. Pumping past the line buys a few weeks of supply and costs the water source for years after the El Niño has passed.

* Suggested formulation: check with a health worker before sharing.

Instead: action 8: a published salinity limit, a written stop rule, and delivered water for the vulnerable (action 4) when it is reached. More cuts now, with water delivered to those who need it, rather than a salted aquifer.

7. Do not count the shelters opened as the people sheltered

`CONTRAINDICATED` `ISLAND-WIDE (RE-X07), WEST VERSION`

In Belal, 158–161 shelters opened, about 600–640 people came (Outremers360; Reporterre), and three homeless people died. Réunion La 1ère reported that the Saint-Gilles man had refused shelter (a place in Saint-Paul); the Interior Minister said others "auraient refusé" (conditional). A count of centres opened says nothing about whether the people at risk came in.

Instead: measure people sheltered against the named list (action 1); report how many on the list were walked in, and who refused and why.

8. Do not drink tap water, or refill drinking-water stores, straight after the supply comes back *

`CONTRAINDICATED` `ISLAND-WIDE (RE-X06), WEST VERSION`

When a network refills after a cut, it draws in sediment and can be contaminated. In the 2023 water crisis the ARS Mayotte advised not drinking tap water for 6 hours after a night cut and 12 hours after a cut of 24 hours or more, or boiling it for five minutes, and keeping stored drinking water no more than 48 hours. TCO has recurring cuts in the Saint-Paul hauts and restrictions in Le Port and La Possession.

* Suggested formulation: check with a health worker before sharing.

Instead: put a "first flush" line on every TCO and operator cut notice: run the tap and do not drink for the stated hours after supply returns, and rotate or treat stored drinking water every 48 hours. The hours should be set by the ARS Réunion, since the Mayotte figures are from another network.

9. Do not wait for a river reading to evacuate behind the Rivière des Galets bank

CONTRAINDICATED WEST (TCO)

The only flow gauges on the Rivière des Galets are at the intake dams upstream. Vigicrues Réunion issues vigilance on observation only, with no 24-hour forecast, and is suspended in red and violet cyclone alerts (DEAL, Garance review, April 2025). A flow trigger would fire when people are already confined indoors.

Instead: pre-evacuate the homes behind épis 4 and 5 at alerte orange (action 5).

WHAT HAS HAPPENED HERE BEFORE THE RECORD

YEAR	EVENT	TOLL	WHAT CHANGED AFTER
1948 (Jan)	Cyclone; the island's deadliest	165 dead, island-wide (no ENSO record before 1950)	—
1980 (Jan)	Hyacinthe, record rain (3,240 mm in 3 days at Commerson crater); ravines flooded L'Hermitage and La Saline (neutral: ONI ≥+0.5 for only three seasons, short of NOAA's five)	25 dead, island-wide; none recorded in TCO	—
1987 (Feb)	Cyclone Clotilda (El Niño, +1.2)	9–10 dead, island-wide; no West impact verified	—

* Suggested formulation: check with a health worker before sharing.

YEAR	EVENT	TOLL	WHAT CHANGED AFTER
2002 (Jan)	Cyclone Dina; Hermitage–Saline coast and Saint-Paul town flooded, water up to 3 m (neutral, −0.1)	No deaths recorded in the flooded area; 1,390 buildings and 165 ha flooded. Island-wide, no direct deaths and 5 to 6 indirect (IGE, 2003)	Studies, then the €25M Hermitage flood programme (PAPI) for 4,800 people; central Saint-Paul and Saint-Leu were to follow
2005–06	Chikungunya epidemic (La Niña, −0.9)	203 death certificates, island-wide	Door-to-door Kass'Moustik campaigns from 2006
2007 (Feb)	Cyclone Gamède (El Niño, +0.6); the Rivière des Galets dike between épis 4 and 5 sagged	2 dead on Réunion (one a driver from Le Tampon; where the other died is not settled) and about 90 injured; one of the two RN1 Saint-Étienne bridges collapsed	Emergency repairs to the 4–5 bank, repeated "systématiquement" since
2011 (Oct–Nov)	Maïdo fire, hauts of Saint-Paul (La Niña)	No deaths; about 2,700–3,000 ha	Water-bombing aircraft pre-positioned for the 2012 dry season
2020 (Nov)	Maïdo fire, in a drought year (La Niña)	No deaths; 175–181 ha	—
2024 (Jan)	Cyclone Belal, the first violet alert (El Niño, +1.8); Rivière des Galets at 1,012 m³/s	1 dead in TCO (a rough sleeper at Saint-Gilles); 3 island-wide, all homeless	Provisional fill at épi 5; the State's fund paid 56 uninsured people about €29,000, about six months later (11 July 2024)
2025 (Feb)	Cyclone Garance (cool-neutral, −0.5); Rivière des Galets went round épi 5	2 dead in TCO (a mudslide in Trois-Bassins; a man found at Ravine Bassin, Saint-Paul); 5 island-wide; more than 310,000 without drinking water	Permanent works on épis 4–5 scheduled for 2026–27

* Suggested formulation: check with a health worker before sharing.

YEAR	EVENT	TOLL	WHAT CHANGED AFTER
2025–26	Driest rainy season in 54 years of records (−45%, provisional; −60 to −70% in the hauts), the second deficit season in a row (neutral)	No deaths recorded; restrictions in Saint-Paul, Le Port, and La Possession from 25 Feb 2026	Saint-Paul hauts protest over cuts, 8 Apr 2026; salinity at "seuils préoccupants"

The recurrence nobody has noticed: the same 300 metres of the Rivière des Galets bank above Le Port have failed in Gamède (2007) and been undercut in Belal (2024), both El Niño seasons, and the permanent fix for épi 5 is scheduled for 2027. On this coast "El Niño means dry" is the wrong lesson: two of three of the West's big rain events on record (Gamède, Belal) fell in El Niño seasons, and the third, Hyacinthe, in a warm-neutral one. TCO's deaths have come not from wind but from people outside: a rough sleeper, a house below a slope, a man in a ravine.

WHERE THE EXPERTS DISAGREE

UNRESOLVED

- **Keep the taps running** versus **protect the aquifer**. The emergency manager wants continuity for the hauts; the skeptic argues that in Le Port and La Possession the right call may be more cuts now, with water delivered to the vulnerable, rather than pumping past the salinity line. This briefing takes the skeptic's side (action 8, *Do not* 6). Published conductivity readings for the Le Port boreholes would show how close the line is.
- **Hold the water-bombing aircraft on the island into the cyclone season** (skeptic, historian) versus **the fire window is now, not January**. The big Maïdo fires burned in October–November, all in La Niña years, and Météo-France expects normal to above-normal rain from October to December. The 2020 fire stopped at about 175 ha with an aircraft present, against about 3,000 ha in 2011, but that is a correlation. No action is ranked on fire; the Préfecture's current deployment calendar for the aircraft was not verified.
- **Food kits** (food supply, philanthropist) versus **cash** (verification). The port reopened within three days after Belal and shops reopen by prefectoral authorisation, so cash (RE-F01) does more once markets work; the food kits are kept for the first three days only.
- **Covers on stored water** versus **clearing small containers**. Restrictions drive storage, but Réunion's own field data (Delatte et al. 2008) point to small discarded containers and ravine rock holes. A larval survey of a restricted quartier in Le Port this November would size the cover line.

WHAT NOBODY COVERED

BLIND SPOT

No lens examined visitors. Saint-Gilles and L'Hermitage are Réunion's beach resort, and the cyclone season is the southern summer holiday: hotel guests, gîte renters, and campers who do not know what an alerte orange means, have no car, and are not on any CCAS list. Nor did any

* Suggested formulation: check with a health worker before sharing.

lens examine the 230,000-person load on one hospital, the CHOR at Saint-Paul, when the coast road to Saint-Denis closes in swell. If a cyclone and a dengue rise coincide, both gaps land on the same emergency department. The PICS annex should name who warns the tourist accommodation, and how the CHOR is resupplied when the road is shut.

HOW TO READ THIS

METHOD

The panel is author-built. Eight simulated expert lenses were used to generate these recommendations. Where they agree, that is a strong hypothesis, not a consensus of the field. Every recommendation was then independently checked for evidence, transferability to this location, and feasibility before the peak; the verdict tags carry the result.

Mortality figures are resolved at Climate Impact Lab impact-region scale. They are not neighbourhood figures. The El Niño projection covers *heat only*; drought, flood, fire, smoke, and crop failure are additional to it and are carried here by the historical record rather than by a published number. Here the study's map publishes a row for the Saint-Paul arrondissement: 1 death. That arrondissement is the five TCO communes, 222,009 people, Mafate included. Taking out Mafate's about 900 people (TCO, 2025) gives 1 × 221,100 / 222,009 ≈ 1.0. That subtraction is our arithmetic, not an Impact Lab finding; the cirques briefing carries Mafate's share (about 0.004).

HOW THIS BRIEFING WAS PRODUCED

METHODOLOGY

- **Scope.** The location was taken as given: West (TCO), Réunion, without Mafate, the fifth zone of six in the Réunion set, aligned to the five intercommunal water authorities. Climate Impact Lab impact region, as the report records it: REU.Re7bdb3a99bec931b, the whole island (about 890,000 people; label unconfirmed). The study's map publishes a finer row for the arrondissement of Saint-Paul (GADM level 1), which is the five TCO communes including Mafate. Sub-commune detail is used for hazard exposure and action design, not for death counts.
- **Exposure.** Climate Impact Lab, *451,000 at Risk* (September 2026, pre-peer-review): ECMWF SEAS5 seasonal forecasts (51-member ensemble) applied to temperature–mortality relationships across 24,378 regions, against a 1996–2025 baseline, for June 2026 – February 2027. It covers heat only. The figure here is the 6-month field (`6mo_hotonly_total_mean`) of the study's map (Flourish visualisation 30298258), read for the set in the CINOR run and reused, not re-fetched. It is never added to the Impact Map's long-run projections or quoted from the map's GDP-denominated mortality. Cyclones, water cuts, dengue, and leptospirosis are carried by the historical record.
- **Expert panel.** Eight simulated expert lenses (emergency manager, public health scientist, frontline responder, skeptic, economist, historian, philanthropist, and food supply chain analyst) each researched this place independently and in parallel, from web sources, to a fixed brief. A

* Suggested formulation: check with a health worker before sharing.

ninth agent gathered local facts (VigiEau on the day, operators and network efficiency, households, health data). Each worked from a shared pack of facts already verified for the Réunion set, and each was told to re-check any fact it used.

- **Reconciliation.** Duplicate actions were merged and backing lenses recorded. Convergence was tested for shared bias (whether the evidence behind an agreed action came from a setting like this one) before it counted in an action's favour. Contradictions were kept, not resolved by dropping a side. Actions were ranked by expected lives saved per unit of effort before the peak, each was given a named payer and trigger or marked unfunded, and the funding placements were reconciled against the ranked list. The historian's épi 5 finding was added after the panel and verified separately.
- **Verification.** Seven verifier agents checked every recommendation on three tests: evidence (the primary source and its effect size), transferability (whether that evidence came from somewhere like here), and feasibility (whether it can be done here before the peak). The financial and food actions were also checked for availability in French law, a named payer, a trigger, and whether they already exist. The funding envelope was checked for real recipients, published unit costs, and duplication, then re-summed. Every row of the record was checked at source against NOAA ONI.
- **Who does what.** The RACI chart is built from the owners named in the verified actions, with one accountable party per action. It is a proposal: no organisation named in it has been contacted or has agreed to a role.
- **Verdicts.** *Confirmed*: evidence, transferability, and feasibility all hold. *Partially confirmed*: holds after the corrections shown. *Unverified*: could not be checked to a primary source. *Contraindicated*: would do harm or waste the window here.
- **Adaptation Inventory.** Consulted for the set in the CINOR run (96 entries, read from the data embedded in the inventory page) and not re-read here. It holds no entry for France, Réunion, or any small island, and none for mosquito-borne disease. The nearest precedents are heat warning systems (Italy, the US, Canada) and anticipatory cash for floods (Bangladesh, Nepal), shown in the tags where they apply.
- **Health wording.** Passages where a wording error could hurt someone (second dengue infections, the chikungunya vaccine, drinking water, and tap water and stored water after a cut) are marked "* Suggested formulation: check with a health worker before sharing." They were checked against published sources, not by a health professional. They are suggestions, not medical advice, and anyone passing them on should confirm them with a doctor, pharmacist, nurse, or community health worker first. The marker was added on 2 November 2026.
- **Rules.** No cost is derived by dividing a published total, and no local figure is invented; where data is thin, the report says so and labels its estimates. One exchange rate (ECB, 14 October 2026) and one set of unit costs are used across the Réunion set. Every source is listed below with its verification status.

* Suggested formulation: check with a health worker before sharing.

- **Limits.** The panel and verifiers are AI research agents working from web-available sources, not human experts, and no one in this place was interviewed. Several pages returned 403 or would not render (Secours Catholique, some Santé publique France PDFs, Légifrance, a prefecture release on the Le Port boreholes), so some facts rest on search summaries or other outlets, and are flagged where used. INSEE's commune and EPCI pages returned errors to one verifier; the TCO household and poverty figures were read there by two other agents. The Le Port and Saint-Leu operators come from secondary records. No Réunion price was found for covers, kits, or delivered water. Whether TCO has a PICS or a water-pack contract is unknown. No commune-level death record was found for any event before 2024.
- **Revised 2026-10-15 after the set audit (fixes applied:** water-kit release moved to pré-alerte or alerte orange before a forecast or announced cut, with one kit description; the deficit worded as Météo-France's provisional season review, "provisional" restored; Hyacinthe relabelled neutral, so two of three West rain events (Gamède, Belal) fell in El Niño seasons; Gamède, Dina, and Belal tolls and dates set to the set's values, and the Belal refusal worded as reported; the PICS date and co-adoption; the leptospirosis vaccine framed alongside prevention, with the set's eligibility, schedule, and timing, and the West's lepto data dated to 24 June; dialysis figures from the Senate report; summary line on the aquifer softened to "takes years to recover"; action 7 phase aligned; sources added for the Saint-Paul CCAS figures, Belal shelter numbers, April 2025 prices, and the épis costs; the Mafate overlap noted on the cover ceiling with no money change; the template impact-region population clause deleted; map links to island items (RE-01 as a related action; Do not 7 and 8 as copies of RE-X07 and RE-X06; zone events referenced to the island events with zone-only deaths). The envelope is unchanged.)
